

Newborn Piglets

MSP[RS] Resistant Starch can be used day one, starting in the farrowing crate. This gentle gut health solution helps set the stage for improved digestion and prevents scours in this early life stage.

STARTING IN THE FARROWING CRATE

During this life stage, MSP[RS] Resistant Starch can be given to piglets with a dual function, helping to both manage gut health and help keep piglets dry. The fine powder is easily introduced to piglets when it is sprinkled onto heating mats, providing both the benefits of a drying agent and the opportunity for them to get accustomed to the taste. Additional product is provided in bowls, helping to ensure adequate ingestion and improved gut health.

01

FARROW

MSP[RS] Resistant Starch can be given to piglets day one, giving piglets a great start.

DURING THE FARROWING STAGE, MSP[RS] RESISTANT STARCH

- Can be used in piglets starting day one
- Sets the stage for good gut health early
- Helps to develop the microbiome for a more resilient piglet
- Offers a dual function to aid in keeping piglets warm and dry
- Reduce variability of runts and cross-fed piglets by weaning
- Plays an important role in improving piglet performance overall

Experts agree that we need to start early with our piglets. Improve their gut health on day one!
